

# Simple simulated mobile banking App

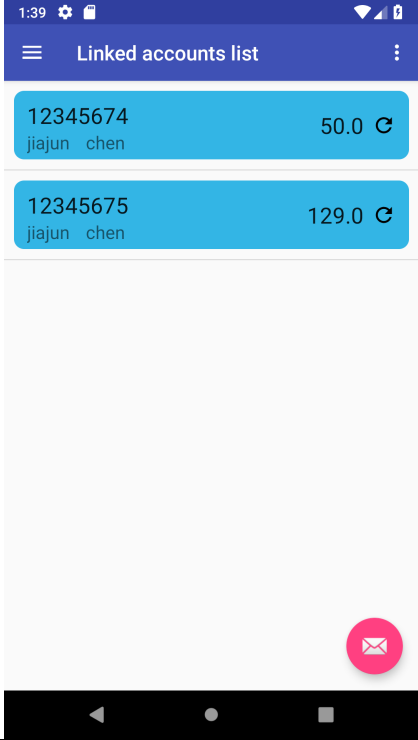

- The purpose of making this simulated app is totally out of interests on mobile software development and the wish to implementing known knowledge from college into real practice.
- This simulated mobile banking app mocks several basic services provided by mobile banking app on the market, such as account register and login, transfer and payee maintenance.
- The development process includes the development of the application on Android platform, server code and database code.
- The development process goes through four parts:
  - 1: clients provide their demands;
  - 2: analysis of the demands from clients;
  - 3: software design which includes two sub parts, overall design and detailed design.
  - 4: software development.

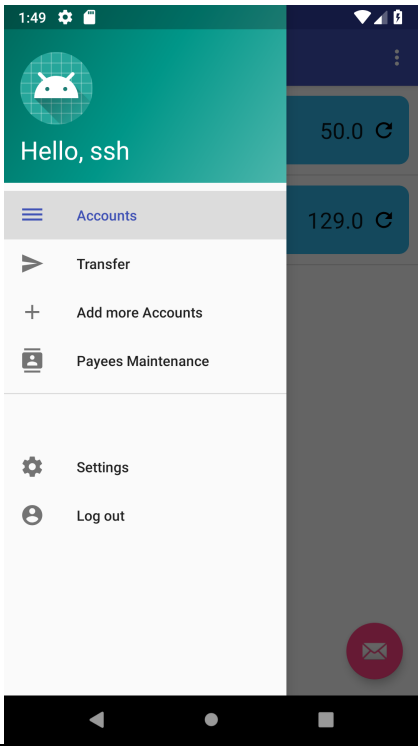

## Demo

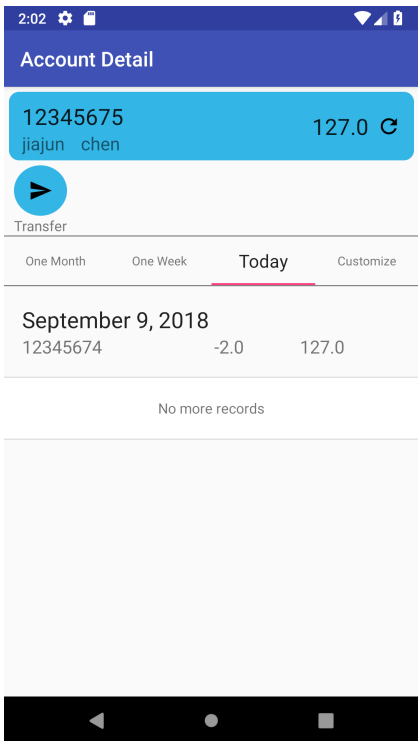

Interface/View	Interface description
